TITLE:TILTING HINGE FOR OA APPARATUS

Abstract:

PROBLEM TO BE SOLVED: To provide a tilting hinge for OA apparatus capable of giving a change to the friction torque while a display is in the opening/closing operation.
SOLUTION: A tilting hinge for OA apparatus is composed of a wind-tight part 3 having wind-tight piece 3a and a wind-in part 4 installed on a bearing plate 1b on the side with device body in such a way as possessing the axis commonly, a fastening screw 6 to engage the wind-tight piece with the bearing plate, and a rotary shaft 7 including a sub-torque generating part 7c and a main torque generating part 7b installed on the side with the display, wherein the main torque generating part is inserted in the wind-tight part while the sub-torque generating part is inserted in the wind-in part, and the main friction torque is generated by tightening the main torque generating part of the rotary shaft with the wind-tight piece of the wind-tight part, while a sub-friction torque is generated by fitting by pressure the sub-torque generating part of the rotary shaft into the wind-in part.
